AERTEC Solutions developed the design expansion for Tocumen International Airport for FCC (a Spanish contractor) to bid on the project for the design and construction of the airport expansion.

The project included the pre-design of a new passenger terminal that connected to the current one, a new control tower and the development of a new runway and taxiway system.

In terms of visual aids, AERTEC Solutions developed a complete overhaul programme for airfield lighting and apron floodlighting.

AERTEC Solutions' pre-design focused not only on achieving a solution which improved the capacity and raised the global level of safety of the airport, but also kept in mind constructability and ease of maintenance during operation.
