CATSALUT / Airfields: Design and processing of heliports and helipads (2004)

The Pallars County Hospital located in Tremp (Lérida) set up a heliport on the roof of the building. It was one of the first heliports to be legalised in Spain. Regional (unique at the time), national and international (ICAO) regulations were fulfilled during the design and legalisation process.

The facility's aeronautical design was carried out first and works management was subsequently performed as the developer's representative.

Finally, all the necessary technical and administrative documents were prepared to legalise the heliport in accordance with the administrative procedures that were in force at the time.
