The Jerez de la Frontera Hospital has planned the construction of a permanent helicopter base to provide emergency services. It consists of a ground-level heliport that will be equipped with an ancillary building to allow crew members to rest.

A preliminary wind and obstacle study was conducted to determine approach and take-off trajectories. In addition, the necessary documents were also processed for the first stage of the authorisation process to set up the heliport.

AERTEC Solutions has also been commissioned to draft the design project's aeronautical part (geometry, visual aids, etc.).
